

## University Licenses for the Cmpware CMP-DK

Cmpware, Inc.

The *Cmpware Configurable Multiprocessor Development Kit (CMP-DK)* is a multiprocessor simulation and software development environment which provides fast and efficient modeling of multiprocessor architectures as well as support for software development on such systems. The goal of supporting software development is achieved by providing an interactive, display-rich environment that permits large amounts of information to be displayed in a fast, simple and intuitive format. Such capabilities are essential in analyzing the behavior of complex multiprocessor systems.

*Cmpware* wishes to make the *Cmpware CMP-DK* available to multicore, multiprocessor and other projects at the university level. For this reason, *Cmpware* is offering substantial discounts, as much as 90% off the listed price, for full versions of the *Cmpware CMP-DK* toolkit. These licenses are available only to qualified university projects.

If your project is interested in a university license, we recommend you first try the free demonstration version of the software and see if it meets your needs. If your project requires some of the more powerful features of the *Cmpware CMP-DK*, such as the ability to build and modify multiprocessor simulation models, then you may need a fully licensed version of the software.

To qualify for a discounted university license, *Cmpware* requires that a one page summary of the project and the role of the *Cmpware CMP-DK* in the project be submitted by the principal investigator of the project. This summary should include full contact information, project name and any other project affiliations.

Groups of licenses for classroom or laboratory use are also available by special arrangement with *Cmpware*. Further discounts for five or more university licenses are also available. Contact us at [info@cmpware.com](mailto:info@cmpware.com) for more information on our university program.
